

From concept and circuit architecture to production-ready PCB design and manufacturing support.

Engineering Partner for Electronic Product Development

EVOARC is an electronics engineering company focused on PCB design, hardware development, research and development, and technical consultancy. We help organizations convert product ideas and engineering requirements into robust, manufacturable electronic solutions.

What We Bring

Engineering-first thinking	Design decisions are driven by electrical performance, reliability, manufacturability and cost.
End-to-end support	Support from requirements and architecture through PCB design, prototype preparation and production documentation.
Design for manufacturing	Layouts are developed with fabrication, assembly, inspection and supply-chain realities in mind.
Flexible engagement	Suitable for new product development, redesign, design review, overflow engineering and consultancy.

Our Mission

To deliver practical, reliable and cost-effective electronics engineering solutions that shorten development cycles and help our clients move confidently from idea to product.

Our Vision

To become a trusted engineering partner for innovative electronics products across startups, SMEs and technology-driven organizations.

Our Services

PCB DESIGN

- Schematic capture and review
- Multilayer PCB layout
- High-speed and differential-pair routing
- Controlled impedance
- Power and ground strategy
- DFM / DFA review
- Library and footprint development
- Gerber / manufacturing data preparation

HARDWARE DEVELOPMENT

- Analog and digital circuit design
- Microcontroller-based systems
- Power supply and power electronics
- Sensor interfaces
- Communication interfaces
- Prototype hardware support
- Design validation support

R&D; / PRODUCT ENGINEERING

- Proof of concept
- New product development
- Existing design enhancement
- Reverse engineering support
- Component replacement / redesign
- Cost and BOM optimization
- Engineering feasibility studies

TECHNICAL CONSULTANCY

- PCB design review
- Architecture review
- Component selection
- Signal / power integrity guidance
- Manufacturing issue resolution
- Design risk assessment
- Technical documentation

PCB Design Capabilities

	Capability
PCB Technology	Single-sided, 2-layer, multilayer, HDI, rigid, flex and rigid-flex*
High-Speed	USB, Ethernet, differential interfaces, high-speed digital routing*
Routing	Differential pairs, length matching, impedance-controlled routing
Power	High-current paths, power planes, decoupling and thermal considerations
RF / Wireless	RF layout support for wireless and antenna-connected designs*
Manufacturing	DFM/DFA checks, fabrication and assembly documentation
Verification	ERC/DRC, design review, stack-up and constraint review

*Capability availability depends on project requirements and engineering scope.

Typical Design Focus

Signal integrity and clean return paths • Power integrity and robust decoupling • Thermal and current-carrying considerations • Component placement for performance and assembly • Design-rule and manufacturing constraint compliance

Our Engineering Workflow

01	REQUIREMENTS	Understand product goals, interfaces, constraints and deliverables.
02	ARCHITECTURE	Define functional blocks, power domains, interfaces and key design risks.
03	SCHEMATIC	Develop and review the electrical design with component and connectivity checks.
04	PCB LAYOUT	Create placement, stack-up, routing, grounding and manufacturing-ready geometry.
05	DESIGN REVIEW	Perform ERC/DRC and engineering review with SI/PI, thermal and DFM considerations.
06	RELEASE	Prepare fabrication, assembly and production documentation for prototype or manufacturing.

Industries & Applications

• Industrial Automation	• Robotics & Motion Control	• IoT & Connected Devices
• Automotive & EV Electronics	• Consumer Electronics	• Smart Energy
• Instrumentation & Data Acquisition	• Telecommunications	• Embedded Systems

Example Project Themes

- Sensor interface and camera-connected electronics
- Embedded controller and communication boards
- Motor control and actuator electronics
- Power management and monitoring boards
- Industrial communication gateways
- Data acquisition and instrumentation systems

From Design to Manufacturing

EVOARC can support the engineering handoff with organized design and manufacturing documentation tailored to the project.

	Manufacturing	Documentation
Schematic source files	Gerber / ODB++*	Fabrication drawing
PCB source files	NC drill files	Assembly drawing
Library / footprint data	Pick & place	BOM
3D PCB / STEP model	Panelization support*	Release package
Design review reports	Prototype support	Engineering notes

Quality Mindset

Our design approach emphasizes correctness, manufacturability, documentation quality and maintainability. Reviews are structured to identify electrical, layout and production risks before release.

Confidentiality

Client information and design data can be handled under NDA and project-specific confidentiality requirements.

Let's Build Your Next Electronic Product

Whether you need a complete PCB design, hardware engineering support, a design review or a technical partner for product development, EVOARC is ready to discuss your requirements.
